QUALITY MAN AND QUALITY OF LIFE - THE HIGHEST LEVEL OF QUALITY

Abstract: *Early comprehension of the concept of quality are primarily related to finding models and methods for improving the technological, sensory, functional and other properties quality products and services, and certainly the process, which meet with some practical human needs. The concept of quality in the meantime, spread, and in the meantime, at the beginning of III millennium identify some new dimensions and new in the concept of quality. This is a quality man and his behavior, and quality of life, quality phenomena that are increasingly coming to the forefront of scientific and social issues.*

Keywords: *New Development Paradigms, New dimensions of quality, quality person, quality of life, the New Age man*

1. INTRODUCTION

Chronicles the development of human society, but also scientists and researchers-quality undivided phenomena are of the opinion that the quality - as a mark of excellence level of production, consumption, and content of life materially and conceptually expands and gets a new dimension.

The process of quality development phase is undoubtedly a process that is not only because of technological character gets a certain social, psychological and other conceptual definitions. The subject of this paper is to analyze the historical development of the concept of quality with emphasis on a new understanding of the concept of quality with which mankind has entered the 21st century and you-III-c and their respect for the millennium. The focus of the presentations focused on the short explanation of it terms "quality man", ex. QM (Quality of Men) and "quality of life", ie. QL (Quality of Life), through which concepts are expressed both and all other facilities and all other dimensions of the concept of quality.

2. DEVELOPMENT QUALITY MANAGEMENT

The development strategy of quality - stemming from each other took place gradually and in stages. The analytical age and quality of feudalism was the subject of attention of manufacturers and vendors of individual products and services. The strategic approach to quality is related to the first (since 1850) and second (from the 1900.te) industrial revolution. This was the period when the professional obligation for product quality and / or services have been connected to group teamwork. Since then they have differentiated the next stage of development of quality management: Phase-control and product testing - J and T (Inspection and Test)
-Phase Quality Control - QC (Quality Control)
-Phase quality assurance - QA (Quality Assurance)
-Phase Total Quality Management (MTK)
- TQM (Total Quality Management) and at the end

Phase-quality people and quality of life - QM (Quality of Men) and QI (Quality of Life).

1. PHASE (STRATEGY) CONTROL AND PRODUCT TESTING - affirmed and developed and 30 of the last century when they were created and then successfully operated large industrial enterprises in the Western Hemisphere. In this period, there appeared the first technological control in manufacturing plants whose task was to control the senses through the products were done in relation to set standards of quality. Unsound products are thrown away or repaired and reconstructed.

2. PHASE (STRATEGY) QUALITY CONTROL - full recognition has occurred between the 1930-year. This strategy is also focused on the production and derived products. The difference from the previous phase was reflected in the fact that the controllers had significantly more perfect controls, and indicators of quality, which indicates that the control is in a technical sense, but was technologically objectified.

3. PHASE (STRATEGY) QUALITY ASSURANCE - affirmed in the period from 1960 to-1975. The strategy is implemented on the basis of pre-designed and set quality control system. This system included the entire business process of the company, not just manufacturing. In the foreground were the desires and interested customers, which is already known in business firms.

4. PHASE (STRATEGY)
 Quality Management - is a further qualitative leap in the development of quality systems. In well-managed enterprise strategy has seen a rise in the period 1975-1990. The characteristic of this strategy is reflected in the fact that are based on previously set goals all the features and quality of all activities in the

firm goals. Based on the established hierarchy of subordination were assessed assignments of all organizational parts, and all in the field of development and improvement of quality.

5. PHASE (STRATEGY) Total Quality Management - to promote a guide since 1990. good for now - in terms of technology highest range of strategic and operational management of quality. A feature of this phase is evident in the strict application of comprehensive involvement and commitment of all managers and executors of work, and also all partners (suppliers, customers and others), and indeed all other interested stakeholders - stakeholders, the firm's work. The prim determination, saturation, and production services companies are not only customers whose desires and interests to be met, but that included all other subjects of interest connected with the organizations that operate and who express an interest in her work. In the application of total quality strategy not only perceive the interest of their stakeholders in order to meet, but is subject to vigilant attention of managers and others involved in the work of employees overall community.

6. PHASE QUALITY MAN AND QUALITY OF LIFE STAGE - the strategic approaches that are still in the final stages of defining and shaping. The above does not mean that the quality and the quality of human life have long been the focus of attention of some subjects of economic, political and social decision-making in general. The next section of this paper is devoted to the summary explanation of these terms.

3. QUALITY MAN - NEW DEFINITION OF QUALITY MANAGEMENT

The quality of homo sapiens as producers and consumers until recently

been the subject of attention of serious scientific research. If we exclude quasi-scientific theories "Aryans" of inferior and superior races - which are based on qualitative differences between people and requested otherwise found in the genetic characteristics of certain breeds, other publicly published scientifically based research on these issues is almost non-existent. Psychological research related to IQ (coefficient of intelligence), they nevertheless explicitly indicated intellectual differences among people - but on that and then stopped. Subsequent psychological contributed to identifying seven types of intelligence, the problem of intellectual problems to people. Identify the seven types of intelligence pointed to the fact that it is not easy to classify people according to some value exactly measurable intellectual and qualitative determinations.

Scientific and professional papers known last 10-15 years suggest that the notion of qualitative intelligence extends to other areas. In the business literature is increasingly emphasized and concepts: contextual intelligence (lengths in a given context of business), financial intelligence (resourcefulness in dealing with money), spiritual intelligence, which refers to the extrasensory perceptions and feelings, sexual intelligence and other types of intelligence.

In theory, human resources management stand out as specifying the determinants of the quality of the man above all a certain good or bad qualities of concrete and concrete workers managers. Workers executors of business processes as a valuable stress the quality of the expertise and skills, attitude to the set tasks, company loyalty and hard work. When managers are in the forefront of qualitative definitions put organizational skills, resourcefulness, and also the ability to identify opportunities and, the ability to exploit opportunities and avoid or eliminate hazards.

The term quality of man are engaged in a religious community which in turn determine what is a quality person - man or woman. In the Christian nomination branding the seven deadly sins, whose realization is characterized by poor believers and non-performing people. As is well known as the seven deadly: egocentrism (the church calls it pride), (revenge), covetousness (greed), lasciviousness, gluttony and sloth. Accepting the above definitions religious misconduct as established, it can be that the quality of man - of individuals or smaller or larger be evaluated from the aspect of the above criteria. Stratification and sorting people by qualitative determinations certainly does not mystical circles (Masons, Illuminati, Rotarians, and others) differentiate their membership as qualitatively more valuable than other mortals. Through the process of introducing an initiation ritual organized in their ranks and dedication to the secret knowledge given take action to lodge their members deserved rise to a higher initiation qualitative level. Proponents of the various conspiracy theories present their claims to the global level by some occult secret lodges or organized associations (, Trilateral Commission, and others) is a qualitative stratification of certain peoples and races in a more or less valuable. By better understanding these nations and races are provided the opportunity for a decent life and professional advancement. Inferior peoples, and to exterminate the race as an unnecessary and harmful to human weeds that deplete, pollute and endanger the ecosystem of planet Earth. The same is done for them by skillfully wars caused by the low (controlled) intensity, through a variety of epidemic spread of drug abuse and promiscuity, and other unhealthy or immoral behavior, and certainly in other deleterious ways. Which of the following statements science fiction, and what objective reality is about to give a proper

interpretation of objective scientific research. In any case, whether the alleged overpopulation, or otherwise the quality of man as an individual or a group of more or less typical behavior, and gradually becoming more and more the focus of attention as chronicler of the times in which we live and serious researchers. The phenomenon of man as a quality producer, consumer, staff member, or Mayans larger nation or race groups will obviously be publicly or secretly studied and appreciated, whether it is a functioning business or on general social issues that touch the modern world.

4. QUALITY OF LIFE AS A GOAL AND SCOPE OF RECEIVING QUALITY MANAGEMENT

All practical, technical and scientific issues related to the concept and quality of basic phenomena are aimed at finding out what organizational and technological solutions that will create and offer better quality products and services which they will be properly meet specific consumer needs. The concept of quality observed in this dimension, however, is undoubtedly partial and limited nature. With a single product or a service can be met but one desire or need. What happens to the other needs and desires, which, by Abraham Maslow and his hierarchy of needs rise as meet the needs of lower rank. Fulfilling the need for food and drink certainly can not meet some other emotional status, physical or spiritual needs. Quality of life of individuals, and also certain members of the community, expressed through the possession and consumption of more high quality products and services that meet the

different needs and wants. Comprehensiveness and accessibility of quality goods and services of various types, which are available to the individual and society and just makes good quality of life. But that's not enough. The individual and society is needed in addition to material goods and certain social and emotional security that it provides peace of mind without fear and stress. Security is achieved and quality employment and good business, emotional and other ties with the immediate business environment . The above indicates that we have highlighted the fact that the concept of quality of life as the ultimate goal of quality management can be clearly seen and evaluated ambiguously. Numerous factors are quality of life for some of them are measurable and some immeasurable character. All are in satisfactory terms and scope must be identified to act on them in the right way at the right time. All this indicates that the development of the science of quality came only halfway.

5. CONCLUSION

Previous the concept of quality, we tried to point out the fact that extremely complex and multifaceted concept. The term is no way to treat only the technological and because it would be narrowed in under observation. A further qualitative development of man as an individual, qualitative development of human society, and also the further development of the science of creates new research challenges and opens new horizons in the interpretation and creation of a desirable model of the phenomenon of quality.
